

Qwen routing-budget visualized

A fixed-backend routing example: block classes become a reused/fresh visual budget, not a speedup claim.

A. One real transition: planner rule $\rightarrow$ decision budget

static 81% + shifted 11% $\rightarrow$ reused; fresh 8%

Rule: reused = static + shifted while age < 4; fresh = novel + age-expired.

static / shifted reused

fresh bought

Block classes are freshness evidence; object relevance is still decided by the model/task.

B. Same policy on three real windows

Selected real windows rendered with the same routing policy; budgets are visualization summaries, not speedup claims.
